

# Products and Materials

Our goal at Klamfoth, Inc. is to provide a professional Christmas lighting display while maximizing appearance and minimizing service calls at the best value possible. If you value cheap, poor products, sloppy installation and repeat service call fees, then Klamfoth's Christmas light program is not for you. If you value high end materials, custom installation from trained technicians and guaranteed products at a competitive price, then take a minute to see what products we use and why.

**C9 Stringer** – Typically used for building outline and ground lighting, the empty socket stringer allows us to completely customize your lighting. Unlike minis, icicles or fused sets, the stringer can be cut to length and fit perfectly to your roof outline. No strands that come up too short or excess hanging over the edge. Since the strands are put together for each job individually, we can create any color scheme with incandescent or LED lights. And if any bulb fails we can easily replace it with no loss to the integrity of the whole strand.

**Clips and Attachments** – Klamfoth, Inc. makes every attempt to make your installation as non-invasive as possible. Through the use of the many plastic clips available we can perfectly outline windows, follow gutter lines and ridges or evenly delineate walkways and landscape beds.

**Outdoor Greenery** – We use all weather outdoor garland and wreaths to accent your lighting scheme. All greenery comes from our suppliers unlit so that we may add lights to match each order

**Mini Lights** – Can be used to accent C9's or on their own. Minis are used on windows, around doors and garages, in greenery and in landscape elements. Some will use minis as an inexpensive way to outline a building, but mini strands cannot be cut and may come up short or long on any given run, leaving a sloppy install. This can be an issue with icicles as well. Minis come in both incandescent and LED form.
